

A Platform agreement

Same trait, two platforms: the difference slope ($f - f_{\text{day 1}}$ on day) from pooled WGS against MIP-seq. As Figure 1A.

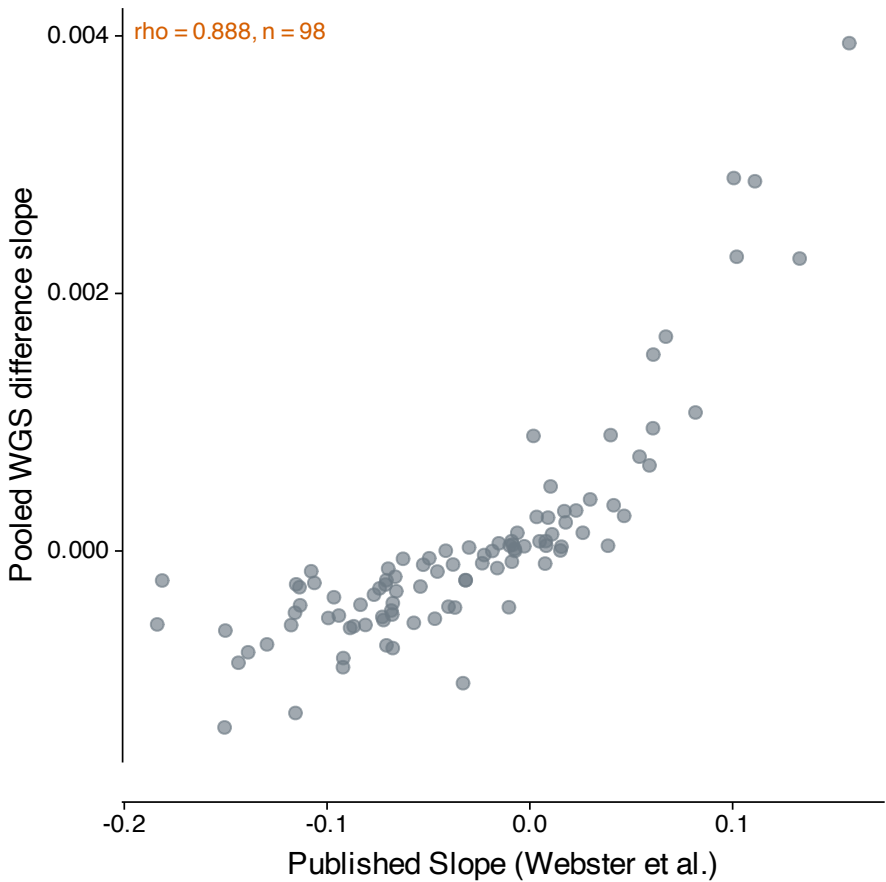

B Trait agreement, published recipe

$\log_2(f / f_{\text{baseline}})$ on day, frequencies
floored at $1/(4n)$. Axes are on the same scale.

C Trait agreement, difference slope

The panel A trait against the published Slope. Ranks only: the axes are on different scales.

D Every comparison on one axis

MIP-seq's own difference slope agrees with the published Slope no better than ours, so the drop from A to B is the change of trait. Ceiling: the published recipe on MIP-seq, restricted to the 15 columns the pooled set covers.
