

A Only the 25% dose has any dynamic range

N2 carries 96T; wSZ203 and wSZ204 are independent lines edited to 96K. At 0% every genotype hatches and at 50% and above every genotype is dead, so those doses cannot report a difference. One plate per strain per dose, Wilson 95% intervals.

B 96K makes N2 more sensitive

The 25% dose alone. Both edited lines drop from 32% to about 4% hatching, an eightfold loss of survival, and they agree with each other. Same direction as JU2466 (96K, sensitive) against JU1793 (96T, resistant), now in a third background.
