

The chromosome IV QTL, and the genes under it

JU1793 × JU2466, bulk-segregant allele-frequency scan. Shaded bands are each contrast's support interval; dots mark its chrIV peak. Below the line, all 222 protein-coding gene models in the window, packed into 8 lanes. **drh-1** is red; the red stripe is *niDf250*, the 159 bp deletion JU1793 carries and JU2466 does not. Both traces are broad plateaus across this window — a very large effect in a bulk-segregant scan gives little positional resolution, which is why *drh-1* sitting near a peak is weak evidence on its own.
