

C

Local charge at gut-lumen pH; T96 sits in the most positive luminal pocket

The pocket: K93 and K132 lie 6.6 and 6.8 Å from T96 (4.5 and 4.4 Å heavy-atom)

Permanent positive charge at this surface increases uptake: the triple His→Arg mutant of McEwan *et al.* internalised more dsRNA than wild type, and T96K increases RNAi sensitivity in all three backgrounds
